

THE CONNECTION/PROTECTION SOURCE

December 2004 – New Protection System for Cable Networks

It's all about network integrity! Service providers continue to emphasize the need for greater network reliability than ever before. With the ever increasing number of choices the consumer has for communication and entertainment services, it is now imperative that the cable networks provide the consumer with the highest quality signal and connections. Providers simply must keep their networks reliable. Today the consumer takes it for granted that their provider will keep them connected! Connected at all times!

Bill Mann, Vice President of Sales and Business Development for Uraseal, Inc., reports the introduction of Uraseal's Shake N' Seal splice closure kits for protecting connections and underground repair splices. "As bandwidth increases, the demand for reliable corrosion free connections is more critical than ever." According to Mann, "Uraseal has designed the CT series of closures specifically to meet the demands of the cable industry at a time when network integrity is coming under ever increasing scrutiny." Said Mann, "our financial analysis of repairing underground cable cuts versus replacing the cables, both drop and hardline, clearly shows that significant savings can be achieved at the system level. By implementing a repair program based around the CT series of products, local network operators will see a positive impact to their repair and maintenance budget."

CT products allow for speedy installation in the most demanding field environments. The permanent seal eliminates the need to return at a later date for span replacement. Now repairs are so simple to perform and extend the connection's service life for so many years, the repaired system quickly pays for itself! Service techs that have worked with the system quickly identify with the systems ease of use. Repairing the line versus replacing it simply makes good economic sense.

Uraseal's CT products exhibit low viscosity for quick penetration that ensures complete splice protection and bonding to the cable jacket and connector during cable repairs. The products exhibit fast gel time, making them ideal for field applications. The Shake N' Seal kits eliminate mix ratio errors and minimize waste. Available in single use convenient packages, the Shake N' Seal kits are perfect for sealing repairs on A/C wiring as well. For over 30 years Uraseal has provided the highest quality and most cost effective solutions for sealing telephone cable connections. Now Uraseal is offering a full line of splice encapsulation products designed specifically to meet the needs of today's broadband operators. No service vehicle or maintenance technician should be without a Shake N' Seal kit! Uraseal, Inc., located in historic Dover, NH, is an ISO 9001 certified manufacturer proudly serving the communications and telephone industries.
